Summary of the Test

The **Personal Information Form** allows users to input and save their personal details such as name, address, email, and other relevant information. This feature is critical for ensuring accurate user data management and updating. The test focuses on validating the behavior of the form under various conditions, including proper data input, form submission, and state management.

Test Scenarios

1. **Valid Data Submission:**
    - Ensure the form accepts valid inputs for all fields and successfully saves the data.
    - Validate that the form clears input fields after successful submission.
2. **Form Validation Errors:**
    - Test for proper error messages when invalid data is entered (e.g., invalid email format, numeric characters in the name, incorrect postal code format).
    - Ensure that no data is saved when validation errors exist.
3. **State Management Verification:**
    - Validate that the user details are saved correctly in the application's internal state (`userDetailsArray`).
    - Confirm the application reflects changes accurately after submission.

Test Outcome

The test ensures:

- The form operates as intended when provided with valid inputs.
- Errors are correctly displayed for invalid inputs.
- Data is stored in the application state after successful submission.

Importance

This test guarantees the reliability and robustness of the personal information management feature, ensuring the end-user experience is smooth and error-free. It also validates the integrity of the underlying data storage.

Running the Test Script: To run the Cypress test script, follow these steps:

1. Before running this project, make sure you have the following installed on

your system:

▪ Node.js (v16.x or higher recommended)

▪ npm (comes with Node.js)

2. Clone the repository:

▪ git clone https://github.com/mentlesoul/CISC327-Group-22-TA.git

▪ cd CISC327-Group-22-TA\Assignment-6

3. Installation dependencies: At the root directory, thus Assignment-6 folder, run bash/shell command below:

▪ npm install

4. Local development launch:

▪ npm run dev

5. Visit http://localhost:5173/ to view the page.

6. To run the Django backend service

▪ cd backend

▪ python manage.py runserver

7. Ensure that all dependencies for Cypress are installed in the project directory.

8. Open a terminal in the project directory and use one of the following commands to run the test script:

▪ npx cypress open: Opens the Cypress Test Runner UI, where you can manually select the test to run.

▪ npx cypress run: Runs the test script directly in the terminal, without the UI.
